Special Lecture of Advanced Medical and Dental Study

Cell to cell communication in oral biofilm

Dental caries is one of the most common infectious diseases affecting humans and several different types of bacteria, especially species of oral streptococci found in dental plaque biofilm, have been shown to be associated with oral infections. The mechanisms by which oral streptococci cause pathogenic lesions and biofilm formation associated with severe clinical manifestations are very important for development of dental caries. In the postgraduate seminar, I lecture on representative viridans oral biofilm streptococci.
